Job Opening

Research Software Engineer (m/f/o)
Full-time Position – Münster, Germany

52°North GmbH is looking for a Research Software Engineer to support our team within the BMU funded project KISTE. You will be working with a team of Geodata enthusiasts and cutting edge software frameworks to explore Geo-AI-based data analytics and its applications.

Your tasks will focus on:
(depending on your skill set)

- Design and development of web and mobile applications based on state-of-the-art methods and technologies
- Integration of scalable data processing frameworks to create analysis-ready spatio-temporal data for ML and AI, based on cloud

Your background and qualifications:

- Diploma or MSc degree in Geoinformatics or Computer Science (or equivalent)
- Significant experience in the field of software development
- In-depth knowledge of state-of-the-art web technologies
- Significant experience in Geodata management
- Good overview of machine learning and related software frameworks
- Very strong German and English language skills - oral/reading/writing
- Enthusiasm for working at the cutting edge of research and professional software development
- Readiness of mind, creativity, team spirit and good organizational skills for your area of responsibilities
- Understanding of scientific process and method

What we offer:

- Internationally operating research institute
- Close cooperation with academia, industry and administration
- Dynamic, highly motivated and dedicated team
- Challenging job with individual responsibilities
- Flat management structure, short communication and decision-making channels
- Ideal environment for personal and professional development (PhD option)
- Congenial, loyal working atmosphere, flexible working conditions (positive work-life balance)
- Münster, a lively student city in the heart of the Münsterland biking country

Job Opening

About us: 52°North is a private non-profit research organization in the field of geoinformatics. We develop new concepts, technologies and innovative applications for geoinformation infrastructures. We are a multidisciplinary team of about 20 researchers, software engineers and data scientists, working on topics such as Sensor Web Technologies, data analytics and near real-time processing of very large volumes of spatio-temporal data. 52°North contributes to many national and international research projects. The application domains are diverse and range from environmental monitoring, disaster control, smart cities to Industry 4.0. Furthermore, 52°North supports customers as a trusted advisor and provides qualified consulting and software development services.
